Data in Many Forms...

Statistics Canada disseminates data in a variety of forms. In addition to publications, both standard and special tabulations are offered on computer print-outs, microfiche and microfilm, and magnetic tapes. Maps and other geographic reference materials are available for some types of data. Direct access to aggregated information is possible through CANSIM, Statistics Canada's machine-readable data base and retrieval system.

How to Obtain More Information

Inquiries about this publication and related statistics or services should be directed to:

Population Estimates Section,
Demography Division,

Statistics Canada, Ottawa, K1A 0T7 (Telephone: 995-2213) or to the Statistics Canada reference centre in:

St. John's (772-4073)	Sturgeon Falls (753-4888)
Halifax (426-5331)	Winnipeg (949-4020)
Montréal (283-5725)	Regina (359-5405)
Ottawa (992-4734)	Edmonton (420-3027)
Toronto (966-6586)	Vancouver (666-3691)

Toll-free access is provided in all provinces and territories, for users who reside outside the local dialing area of any of the regional reference centres.

How to Order Publications

This and other Statistics Canada publications may be purchased from local authorized agents and other community bookstores, through the local Statistics Canada Offices, or by mail order to Publication Sales and Services, Statistics Canada, Ottawa, K1A 0V7.

Des données sous plusieurs formes...

Statistique Canada diffuse les données sous formes diverses. Outre les publications, des totalisations habituelles et spéciales sont offertes sur imprimés d'ordinateur, sur microfiches et microfilms et sur bandes magnétiques. Des cartes et d'autres documents de référence géographiques sont disponibles pour certaines sortes de données. L'accès direct à des données agrégées est possible par le truchement de CANSIM, la base de données ordiolingue et le système d'extraction de Statistique Canada.

Comment obtenir d'autres renseignements

Toutes demandes de renseignements au sujet de cette publication ou de statistiques et services connexes doivent être adressées à:

Section des estimations démographiques,
Division de la démographie,

Statistique Canada, Ottawa, K1A 0T7 (téléphone: 995-2213) ou au centre de consultation de Statistique Canada à:

St. John's (772-4073)	Sturgeon Falls (753-4888)
Halifax (426-5331)	Winnipeg (949-4020)
Montréal (283-5725)	Regina (359-5405)
Ottawa (992-4734)	Edmonton (420-3027)
Toronto (966-6586)	Vancouver (666-3691)

Un service d'appel interurbain sans frais est offert, dans toutes les provinces et dans les territoires, aux utilisateurs qui habitent à l'extérieur des zones de communication locale des centres régionaux de consultation.

INTRODUCTION

Except in census years, Statistics Canada regularly publishes, in Catalogue 91-202 (annual), postcensal estimates of population by sex and age on June 1, computed by the component method. Demographic events registered (births, deaths and immigration) or estimated (interprovincial migration and emigration) since the preceding census are added to or subtracted from the population figures for that census.

When the next census is published, our postcensal estimates are adjusted to make them compatible with the two adjacent censuses. This is how we obtain our intercensal estimates (formerly "revised estimates").

This publication contains **intercensal** estimates of the population by age and sex as of June 1 for the years 1977 through 1980. The corresponding data from the 1976 Census and those from the June 3, 1981 Census adjusted to June 1 have also been included for purposes of comparison. Information on former years may be obtained by consulting Occasional publication Catalogues 91-512 which contains intercensal estimates for the 1921-1971 period and 91-518 (first issue) for the 1971-1976 period. Methodology and sources used to obtain these estimates are also included in both these publications.

We wish to point out that this is the second time that Statistics Canada has published intercensal estimates by individual years of age; formerly, they were published only by quinary age groups. However, users requiring estimates by sex and individual years of age for the 1921-1970 period may obtain them by simply writing to the Population Estimates Section, Demography Division of Statistics Canada.

Sauf pour les années de recensement, Statistique Canada publie régulièrement, dans le n° 91-202 au catalogue (annuel), des estimations postcensitaires de la population selon le sexe et l'âge au 1^{er} juin, calculée par la méthode des composantes: aux populations du recensement, on ajoute ou on retranche les événements démographiques enregistrés (naissances, décès et immigration) ou estimés (migrations interprovinciales et émigration), après le recensement en question.

Quand paraît le recensement suivant, on corrige nos estimations postcensitaires afin qu'elles soient compatibles avec les deux recensements encadrant. On obtient ainsi nos estimations intercensitaires (anciennement "estimations révisées").

Cette publication présente les estimations **intercensitaires** selon le sexe et l'âge au 1^{er} juin des années 1977 à 1980. Les effectifs du recensement de 1976 et ceux du recensement du 3 juin 1981 ajustés au 1^{er} juin sont également inclus afin de faciliter les comparaisons. Pour les années antérieures, on peut se référer aux publications (hors séries) n° 91-512 au catalogue qui contient les estimations intercensitaires, pour la période 1921-1971 et n° 91-518 au catalogue (première édition) pour la période 1971-1976. La méthodologie et les sources utilisées pour obtenir ces estimations sont également incluses dans ces publications.

Insistons sur le fait que Statistique Canada publie ici pour la deuxième fois des estimations intercensitaires selon l'année d'âge; auparavant, ces statistiques étaient uniquement publiées par groupes d'âges quinquennaux. Cependant, il est utile de savoir qu'on peut se procurer les estimations selon le sexe et l'année d'âge de la période 1921-1970, sur simple demande adressée à la Section des estimations démographiques, Division de la démographie Statistique Canada.

HIGHLIGHTS

There were changes in the age and sex composition of Canada's population between 1976 and 1981. The following is an outline of the most noteworthy changes.

(a) Age structure

The age pyramids in Chart I provide a comparison of the age composition of 100,000 Canadians in 1976 and 1981.

In short, it may be said that the age of Canada's population is continuing to rise. This trend shows up on the pyramid as a widening of the point and a narrowing of the base and hence is referred to as (ageing from the bottom up.) When it began about 1961, people over 65 accounted for 7.6% of the population, followed by 7.7% in 1966, 8.1% in 1971, 8.7% in 1976 and 9.7% in 1981.

Coincident with the growth in the number of people over 65, there was a substantial decline in the 0-14 age group. The percentage of the population represented by the latter group changed as follows: 34.0% in 1961, 32.9 in 1966, 29.6 in 1971, 25.6 in 1976 and 22.5 in 1981.

All provinces were affected by the ageing of the population, though to slightly different extents. For the country as a whole, the proportion of young people fell by 12% between 1976 and 1981, and for almost all provinces the figures were between 11% and 13%. Only Saskatchewan deviated significantly from the average, recording an 8.6% drop (from 26.9% to 24.6%). The situation was much the same for the 65 and over age group, in which most provinces gained one percentage point or more, raising the national level from 8.7% to 9.7%. The only exception was Alberta, where the oldest age group decreased proportionally because of the arrival of young migrants between 1976 and 1981 (the over 65 group slipped from 7.5% to 7.3% of the population).

The potential labour force (people between 15 and 64) grew with the ageing of the population. In 1961, 58.4% of the population was in this group, and subsequently the percentage rose to 59.4 in 1966, 62.3 in 1971, 65.6 in 1976 and 67.8 in 1981. Quebec has the highest percentage, with 69.4 followed by Alberta with 68.5. For the latter province, this is again a consequence of the high net migration, since its 1976 percentage was below the national average. The lowest percentages were

FAITS SAILLANTS

Entre 1976 et 1981 la structure par âge et par sexe de la population canadienne s'est modifiée et nous relevons brièvement les changements les plus marquants.

(a) La structure selon l'âge

Les pyramides des âges du graphique I permettent de comparer la répartition par âge de 100,000 Canadiens, en 1976 et en 1981.

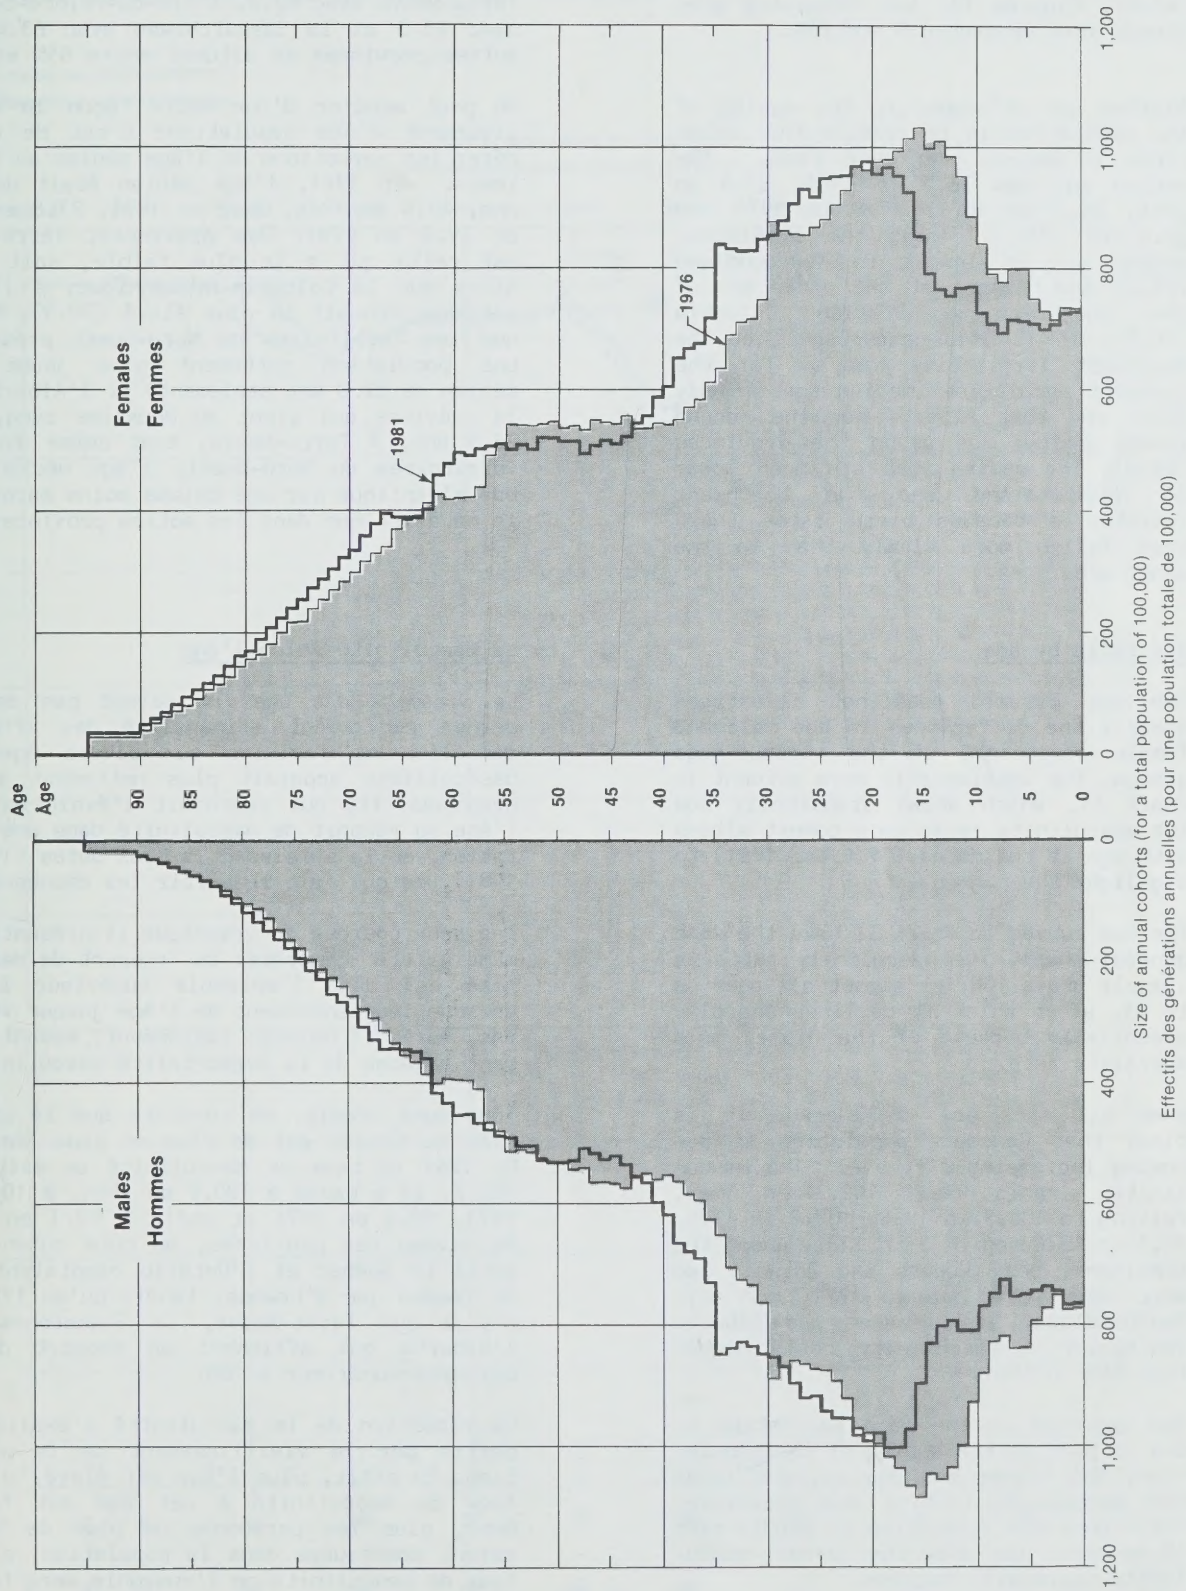

En bref, on peut dire que le vieillissement de la population canadienne se poursuit. Ce vieillissement se marque sur la pyramide par un élargissement du sommet et un rétrécissement de la base. C'est ce dernier phénomène que l'on nomme le vieillissement par la base. Il s'est amorcé vers 1961. En effet les plus de 65 ans qui comptaient pour 7.6% à cette date, sont devenus 7.7% en 1966, 8.1% en 1971, 8.7% en 1976 et 9.7% en 1981.

En même temps que cette hausse des plus de 65 ans, on remarque une chute très importante de l'effectif des 0-14 ans. Pendant la même période on observe les changements suivants dans les proportions de ces jeunes: 34.0% en 1961, 32.9 en 1966, 29.6 en 1971, 25.6 en 1976 et 22.5 en 1981.

Le vieillissement de la population a touché toutes les provinces, avec quelques nuances. Si dans l'ensemble national on constate que la proportion des jeunes a baissé de 12% entre 1976 et 1981, pour presque chacune des provinces, cette chute se situe entre 11% et 13%. Il n'y a que la Saskatchewan qui s'écarte sensiblement de cette valeur avec une baisse de 8.6%, (de 26.9% à 24.6%). Pour le groupe d'âge des 65 ans et plus, la situation n'est pas très différente: les pourcentages dans les provinces ont pratiquement tous augmenté d'une unité, ou plus, entraînant le Canada de 8.7% à 9.7%. L'Alberta fait exception avec une baisse de sa population âgée dont est responsable l'arrivée de jeunes migrants entre 1976 et 1981 (la proportion des plus de 65 ans est passée de 7.5% à 7.3%).

Quant à la population potentiellement active c'est-à-dire les 15-64 ans, elle a vu sa proportion croître avec le vieillissement de la population. En 1961, 58.4% de la population se situait dans ce groupe; ce pourcentage est successivement passé à 59.4 en 1966, 62.3 en 1971, 65.6 en 1976 pour atteindre 67.8 en 1981. C'est le Québec qui connaît la proportion la plus élevée de cette catégorie avec 69.4 suivi de l'Alberta avec 68.5. Pour cette dernière, il s'agit d'une autre conséquence de la forte migration nette, car en 1976 la proportion était inférieure à la moyenne.

Pyramide des âges de la population du Canada, 1^{er} juin 1976 et 1^{er} juin 1981

Source: Statistics Canada, Tables 1 and 6.
Source: Statistique Canada, tableaux 1 et 6.

recorded in Newfoundland (62.8), Prince Edward Island (63.0) and Saskatchewan (63.4). Figures for the remaining provinces were between 65% and 68%.

➤ Another way of measuring the ageing of the population is to examine the variations in median age over time. The median age was 26.3 in 1961, 25.4 in 1966, 26.2 in 1971, 27.8 in 1976 and 29.6 in 1981. Among the provinces, median age is lowest in Newfoundland (25.2) and highest at the other end of the country, in British Columbia (30.9). It is also noteworthy that the Northwest Territories has by far the youngest population (median age of only 22.0) and that Alberta has the second lowest median age among the provinces (26.9). The median ages are much lower in Newfoundland and the Northwest Territories because birth rates there have fallen more slowly than in the other provinces.

place

(b) Sex ratio by age

The age pyramid does not illustrate clearly the differences in the male and female components of the various age groups. The imbalance is more evident in Chart II, which shows graphically how the masculinity ratio in a cohort alters with age at two dates (1976 and 1981) to highlight the changes.

The two curves in Chart II have the same general shape. The masculinity ratio is largely above 100 for almost all ages up to 45, after which it declines sharply, essentially because of the higher male mortality rate.

When all ages are considered, it is clear that Canada's population is becoming increasingly female. The masculinity ratio was 102.2 in 1961, falling to 100.9 in 1966, 100.2 in 1971, 99.1 in 1976 and 98.3 in 1981. Among the provinces, only Quebec and Ontario had more women than men in 1971, and only Newfoundland, Saskatchewan and Alberta registered a masculinity ratio higher than 100 in 1981.

✓ The decrease in the male population is due in part to the ageing of the population. The higher the age is, the lower the masculinity ratio, and therefore, the higher the proportion of people over 50 becomes, the more the overall masculinity ratio will decline.

nationale. Parmi les provinces où cette fraction est la moins importante, on retrouve Terre-Neuve avec 62.8, l'Île-du-Prince-Édouard avec 63.0 et la Saskatchewan avec 63.4. Les autres provinces se situent entre 65% et 68%.

On peut mesurer d'une autre façon le vieillissement d'une population; c'est de considérer les variations de l'âge médian au fil du temps. En 1961, l'âge médian était de 26.3 ans, 25.4 en 1966, 26.2 en 1971, 27.8 en 1976 et 29.6 en 1981. Des provinces, Terre-Neuve est celle qui a le plus faible, soit 25.2, alors que la Colombie-Britannique, à l'autre extrême, connaît le plus élevé (30.9). Notons que les Territoires du Nord-Ouest présentent une population nettement plus jeune (âge médian de 22.0 ans seulement) et l'Alberta est la province qui vient au deuxième rang, avec 26.9 ans. À Terre-Neuve, tout comme dans les Territoires du Nord-Ouest, l'âge médian très bas s'explique par une baisse moins marquée de la natalité que dans les autres provinces.

b) La masculinité selon l'âge

La pyramide des âges ne permet pas de discerner clairement l'inégalité des effectifs masculins et féminins aux divers âges. Ce déséquilibre apparaît plus nettement sur le graphique II, qui reproduit l'évolution avec l'âge du rapport de masculinité dans une génération, en la saisissant à deux dates (1976 et 1981), ce qui fait ressortir les changements.

Les deux courbes du graphique II présentent la même allure générale: le rapport de masculinité est dans l'ensemble supérieur à 100, presque indépendamment de l'âge jusque vers 45 ans, après il baisse rapidement, essentiellement à cause de la surmortalité masculine.

Tous âges réunis, on constate que la population du Canada est de plus en plus féminine. En 1961 le taux de masculinité se situait à 102.2, il a passé à 100.9 en 1966, à 100.2 en 1971, 99.2 en 1976 et enfin à 98.3 en 1981. Au niveau des provinces, on note qu'en 1971 seuls le Québec et l'Ontario comptaient plus de femmes que d'hommes, tandis qu'en 1981, il n'y a que Terre-Neuve, la Saskatchewan et l'Alberta qui affichent un rapport de masculinité supérieur à 100.

La réduction de la masculinité s'explique en partie par le vieillissement de la population. En effet, plus l'âge est élevé, plus le taux de masculinité à cet âge est faible. Donc, plus les personnes de plus de 50 ans seront nombreuses dans la population, plus le taux de masculinité de l'ensemble sera faible.

A FEW DEFINITIONS

Ageing (of a Population). An increase in the number of old persons as a percentage of the total population.

Birth Cohort. A group of persons born within a given 12-month period, the calendar year in general. Unless otherwise indicated, this period will exactly coincide with the census year.

Census Year. The census year refers to the period beginning June 1 of a given year and ending May 31 of the following year.

Dependency Ratio. The total population is customarily divided up into three broad age groups: children (ages 0-17), adults (ages 18-64) and aged persons (ages 65 and over). The following ratios may be defined on the basis of this classification:

- (a) child dependency ratio, i.e., the number of children per adult;
- (b) aged dependency ratio, i.e., the number of aged persons per adult;
- (c) total dependency ratio, i.e., the sum of the child and the aged dependency ratios.

A fourth ratio, the aged-to-child ratio, is sometimes used. It represents the number of aged persons per child.

The same ratios are sometimes defined on the basis of the following categories: children (ages 0-19), adults (ages 20-64), and aged persons (ages 65 and over) or (0-14), (15-64).

Error of Closure. Difference between the population according to a census and the updated postcensal estimate for the same date.

International Migration. Movement of population between Canada and a foreign country which involves a change in residence. A distinction is made between **immigrants** from other countries who settle in Canada and **emigrants** who leave Canada.

Interprovincial Migration. Movements from one province to another involving a change in residence. A person who takes up residence in another province is an **out-migrant** with reference to his province of origin, and an **in-migrant** with reference to his province of destination.

QUELQUES DÉFINITIONS

Vieillissement démographique. Évolution caractérisée par une augmentation de la proportion de personnes âgées au sein d'une population.

Génération. Ensemble des personnes nées durant une même période de 12 mois, l'année civile en général. Sauf indication contraire, il s'agit ici des individus nés la même année censitaire.

Année censitaire. On a convenu de désigner ainsi la période qui s'étend du 1^{er} juin d'une année au 31 mai de l'année suivante.

Rapport de dépendance. On a coutume de répartir la population en trois grands groupes d'âges: 0-17 ans (enfants), 18-64 ans (adultes) et 65 ans et plus (personnes âgées), ce qui permet le calcul des rapports suivants:

- (a) le rapport de dépendance des enfants, égal au nombre d'enfants par adulte;
- (b) le rapport de dépendance des personnes âgées, qui représente le nombre de personnes âgées par adulte;
- (c) le rapport global de dépendance qui est la somme des rapports de dépendance des enfants et des personnes âgées.

Une autre mesure, le rapport personnes âgées-enfants, est parfois utilisée; elle renseigne sur le nombre de personnes âgées par enfant.

Les mêmes calculs sont parfois effectués en retenant les catégories suivantes: 0-19 ans (enfants), 20-64 ans (adultes) et 65 ans et plus (personnes âgées) ou 0-14, 15-64.

Erreur en fin de période intercensitaire. Différence entre la population donnée par un recensement et l'estimation postcensitaire corrigée à la date du recensement.

Migration internationale. Ensemble des déplacements entre le Canada et l'étranger accompagnés d'un changement de résidence. On distingue à cet égard les **immigrants**, qui viennent s'établir au Canada et les **émigrants**, qui quittent le Canada.

Migration interprovinciale. Ensemble des déplacements, d'une province vers une autre, accompagnés d'un changement de résidence. Un individu qui effectue un tel déplacement sera un **sortant** pour sa province d'origine et un **entrant** pour sa province de destination.

June 1 Intercensal Population Estimate. For any given cohort, this is the estimate for a date intermediate to two censuses, which is obtained by taking into account the total number of persons in that cohort enumerated in the censuses immediately preceding and following the year in question, and taking into account the demographic events experienced by that cohort between the two censuses.

June 1 Postcensal Population Estimate. For a given cohort, this is the estimate which is obtained by taking as a base the size of that cohort as of June 1 in the preceding year, and taking into account the demographic events which affected the cohort since that date.

Masculinity Ratio. The ratio of the number of men to the number of women. This is not to be confused with the sex ratio at birth, which is the ratio of the number of live boys born to the number of live girls born. This ratio is usually expressed as an index, with the number of women taken to be a base of 100.

Median Age. An age x , such that exactly one half of the population is older than x and the other half is younger than x .

Number of Complete Years Lived. Age at last birthday.

Population. "Estimated population" and "population according to the census" are both defined as being "the total number of persons whose usual place of residence... was somewhere in Canada, including Canadian government employees stationed abroad and their families, members of Canadian Armed Forces stationed abroad and their families, and crews of Canadian merchant vessels. Not included are government representatives of other countries and their families, attached to the legation, embassy, or other diplomatic body of that country, members of the Armed Forces of other countries stationed in Canada and members of their families who are not citizens of Canada, students attending school in Canada whose usual residence is outside Canada, and residents of another country visiting Canada temporarily." **Dictionnaire of the 1971 Census Terms**, Catalogue 12-540, p. 28.

Undercoverage Rate. The ratio, expressed in percentage, of the number of persons not enumerated in the census (who were intended to have been enumerated in that census) to the total number that should have been enumerated in the census.

Estimation intercensitaire de la population au 1^{er} juin. Pour une génération donnée, il s'agit de l'estimation obtenue en tenant compte de l'effectif de cette génération à chacun des recensements encadrant l'année considérée, ainsi que des événements démographiques survenus entre ces recensements.

Estimation postcensitaire de la population au 1^{er} juin. Pour une génération donnée, il s'agit de l'estimation obtenue en prenant comme base l'effectif de cette génération au 1^{er} juin de l'année précédente et en tenant compte des événements démographiques survenus depuis cette date.

Rapport de masculinité. Rapport de l'effectif du sexe masculin à l'effectif du sexe féminin. Le rapport de masculinité à la naissance désigne le rapport des naissances masculines aux naissances féminines. On exprime généralement ce rapport comme un indice, l'effectif du sexe féminin étant pris pour base 100.

Âge médian. Âge x tel qu'il divise une population en deux groupes d'effectifs égaux, l'un composé uniquement des individus d'âge supérieur à x , l'autre des individus d'âge inférieur à x .

Âge en années révolues. Âge au dernier anniversaire.

Population. La population estimée répond à la même définition que celle dénombrée lors du recensement. Il s'agit donc du "nombre total de personnes dont le lieu de résidence habituelle... était quelque part au Canada, y compris les employés du gouvernement canadien postés à l'étranger et leur famille, les membres des Forces armées canadiennes stationnés à l'étranger et leur famille et les équipages des navires marchands canadiens. Ne sont pas compris les représentants officiels des autres pays et leur famille, attachés à la légation, à l'ambassade ou à un autre organisme diplomatique de ces pays, les membres de Forces armées étrangères stationnés au Canada et les membres de leur famille qui ne sont pas citoyens du Canada, les étudiants qui fréquentent l'école au Canada mais dont la résidence habituelle est en dehors du Canada et les résidents d'autres pays en visite temporaire au Canada". **Dictionnaire des termes du recensement de 1971**, n° 12-540 au catalogue, p. 22.

Taux de sous-dénombrement. Rapport, exprimé en pourcentage, du nombre des personnes qui n'ont pas été recensées (mais étaient visées par le recensement) à celui de l'ensemble des personnes visées par le recensement.

METHODOLOGY AND DATA SOURCES

The intercensal estimates are calculated only after the postcensal estimates previously published in Catalogue 91-202 have been corrected so as to reflect the most recent data on births, deaths and immigration and to reflect the new methodologies used to estimate the interprovincial migration and the emigration. This operation produces **updated postcensal estimates**. A brief description of the method used to obtain these two series of estimates is given below.

(a) Updated Postcensal Estimates of the Population by Age and Sex as of June 1, 1977-1981(1)

These estimates are obtained by the component method, using the 1976 Census counts as the base population.

For example, to estimate the population as of June 1, 1977, the demographic events experienced by each cohort (defined here as the total number of persons born during a given census year) since the 1976 Census were compiled as follows: (the 1976 population count + total immigrants) - (total deaths + total emigrants). The same mathematical procedure is applied to individuals born during the 12-month period under consideration and who will, therefore, have lived less than one complete year by June 1, 1977. It is also necessary to add the interprovincial net migration of each province; obviously, the net migration gains and losses sum to zero at the national level. This produces a postcensal estimate of the total population for each age and each sex as of June 1, 1977. The same procedure is used to calculate the estimates for June 1 of 1978, 1979, 1980 and 1981 using as a base the postcensal estimates for June 1 of 1977, 1978, 1979 and 1980 respectively.

The components of population change are estimated on the basis of data gleaned from various sources.

Data on the number of **immigrants** are supplied by Employment and Immigration Canada; the break-down by province is based on the intended province of destination as specified by the immigrant at the time of his arrival.

During each of the five census years in the period 1976-1981, statistics have been assembled according to year and month of birth.

(1) These estimates are unpublished figures which are used exclusively in the calculation of intercensal estimates.

MÉTHODOLOGIE ET SOURCES DES DONNÉES

Avant de calculer les estimations **intercensitaires**, on a corrigé les estimations postcensitaires déjà publiées dans le n° 91-202 au catalogue, afin de tenir compte des données les plus récentes des naissances, des décès et de l'immigration, et pour tenir compte de la nouvelle méthodologie pour la migration interprovinciale et pour l'émigration. Cette opération donne lieu à des estimations **postcensitaires corrigées**. Donnons quelques indications sur le mode d'obtention de ces deux séries d'estimations.

a) Estimations postcensitaires corrigées de la population selon le sexe et l'âge au 1^{er} juin 1977-1981(1)

Ces estimations, obtenues par la méthode des composantes, ont comme point de départ les résultats du recensement de 1976.

Ainsi, par exemple, pour estimer la population au 1^{er} juin 1977 on a tenu compte, pour chaque génération (définie ici comme l'ensemble des personnes nées au cours d'une même année censitaire), des événements démographiques survenus depuis le recensement de 1976. À l'effectif recensé à cette date, on a donc ajouté le nombre des immigrants, puis on en a retranché le nombre des décès et des émigrants. La même comptabilité est appliquée aux individus nés durant la période de 12 mois considérée et qui auront donc moins d'un an le 1^{er} juin 1977. Pour chaque province, il faut en outre ajouter le solde migratoire interprovincial, celui-ci étant évidemment nul au niveau national. On aboutit ainsi, pour chaque âge et chacun des sexes, à une estimation postcensitaire de la population au 1^{er} juin 1977. Pour calculer les estimations aux 1^{er} juin 1978, 1979, 1980 et 1981 on répète les mêmes opérations, mais cette fois en prenant comme base les estimations postcensitaires aux 1^{er} juin 1977, 1978, 1979 et 1980 respectivement.

Les composantes du changement démographique sont estimées à l'aide de diverses sources.

Le nombre d'**immigrants** est fourni par Emploi et Immigration Canada, la province de destination étant celle où l'immigrant avait l'intention de s'établir au moment de son arrivée.

Pour chacune des années censitaires comprises entre les recensements de 1976 et de 1981, les statistiques ont été réunies selon l'année civile et le mois de naissance.

(1) Ces estimations ne sont pas publiées et interviennent uniquement dans le calcul des estimations intercensitaires.

The number of **emigrants** is estimated from family allowance and income tax information. On the basis of change of address notices, each regional office records data on the interprovincial and international migration of families receiving the family allowance. In particular, the compilation of these data provides us with the number of children who have emigrated. An adjustment factor based on the emigration data for children and adults in income tax files is used to estimate the number of adult migrants.

Age-sex composition is determined by means of a composite approach. It was decided to use income tax data because they are broken down by large age groups (0-15, 16-24, 25-44, 45-64 and 65 and over) and by sex. The percentages for each of these age groups are then divided into quinquennial age groups on the basis of data supplied by the United States Department of Justice, Immigration and Naturalization Service, on the number of people, by five-year age groups, who immigrated to the United States and whose last country of residence was Canada. Finally, to obtain the composition by single years of age, the Sprague multiplier method(2) is applied to the five-year age group data.

Income tax files are used to estimate **interprovincial migration**. The migration status of each taxpayer can be determined from the address of residence information in annual tax returns. The number of dependents that each taxpayer has can then be estimated on the basis of the amount claimed for personal exemptions. Assuming that the dependents migrate with the taxpayers, we can calculate the total number of migrants according to income tax data. However, because the total number of taxpayers and dependents according to income tax data is equal to approximately 90% of the total population recorded by the census, that number is weighted to allow for under or over-coverage for each age-sex group.

A composite approach is used to find the age-sex composition in this case as well. The income tax information for large age groups is broken down into five-year age groups on the basis of census data on interprovincial migration. Once again the composition by single years of age is obtained by applying the Sprague multiplier method.

Data on the total number of **births** per census year were obtained from **Vital Statistics** reports (Catalogue 84-204).

(1) See U.S. Bureau of the Census. **The Methods and Materials of Demography**, by H. Shryock, J. Siegel and Associates, Second Printing (rev.), U.S. Government Printing Office, Washington, D.C., 1973, pp. 688, 699 - 701 and 876.

Le nombre des **émigrants** est estimé à l'aide de deux sources: les allocations familiales et l'impôt. À partir des avis de changement d'adresse, chaque bureau régional emmagasine des données sur la migration, tant interprovinciale qu'internationale, des familles bénéficiaires de l'allocation familiale. La compilation de ces données nous fournit entre autres le nombre d'enfants qui ont émigré. Pour estimer le nombre de migrants adultes, on utilise un facteur de correction basé sur les données d'émigration des enfants et des adultes selon les fichiers de l'impôt.

La répartition, selon l'âge et le sexe est obtenue par une méthode composée. Puisque les données de l'impôt sont regroupées par grand groupe d'âges et par sexe, on a décidé de tenir compte de cette information (ces groupes d'âges sont: 0-15 ans, 16-24 ans, 25-44 ans, 45-64 ans et 65 ans et plus). On répartit ensuite les proportions de chacun de ces groupes d'âges en groupes d'âges quinquennaux selon les données du United States Department of Justice, Immigration and Naturalization Service, qui nous fournit le nombre de personnes, par groupe d'âges de cinq ans, qui ont immigré aux États-Unis et dont le pays de dernière résidence était le Canada. Enfin, pour avoir la répartition par année d'âge, on applique la méthode des multiplicateurs de Sprague(2) aux données par groupe d'âges de cinq ans.

La **migration interprovinciale** est estimée à l'aide du fichier des impôts. À partir de la déclaration de l'adresse de résidence dans le rapport d'impôt à chaque année, on peut déterminer le statut migratoire de chaque déclarant. Le nombre de dépendants de chaque déclarant peut ensuite être estimé à partir du montant des exemptions personnelles. En supposant que les dépendants migrent avec les déclarants, on peut ainsi connaître le nombre total des migrants selon l'impôt. Cependant, puisque le nombre total des déclarants et dépendants selon l'impôt équivaut à environ 90% de la population totale selon le recensement, on pondère le nombre obtenu pour chaque groupe d'âges-sexe pour tenir compte de la sous- ou sur-estimation à chacun de ces groupes.

La répartition selon l'âge et le sexe est obtenue par une méthode composée ici aussi. On prend encore les données de l'impôt par grand groupe d'âges, et on les répartit par groupe d'âges de cinq ans selon les données du recensement concernant la migration interprovinciale. Encore une fois, la répartition par année d'âge est obtenue avec la méthode des multiplicateurs de Sprague.

Le nombre total des **naissances** par année censitaire provient de la statistique de l'**État Civil** (n° 84-204 au catalogue).

(2) À ce sujet, voir U.S. Bureau of the Census, **The Methods and Materials of Demography**, by H. Shryock, J. Siegel and Associates, Second Printing (rev.), U.S. Government Printing Office, Washington, D.C. 1973, pp. 688, 699-701 et 876.

Data on the total number of deaths per census year were taken from Vital Statistics reports (Catalogue 84-206 for 1976 and 1977 and Catalogue 84-204 for 1978, 1979, 1980 and 1981).

In order to produce postcensal estimates, it is first necessary to know the number of deaths per census year (June 1 - May 31), by age and cohort, in this case the census year of birth. This cohort distribution was calculated by breaking down the total deaths according to the age at death of the deceased (zero, one, two and over). Data from various years were used to determine the distribution illustrated in Chart IIb., from which the age of the deceased at the beginning of the census year under consideration (June 1, 1979 in the example chosen here) can easily be determined.

Le nombre total des décès a également été obtenu par année censitaire. Ces résultats sont tirés de la statistique de l'état civil (n° 84-206 au catalogue pour 1976 et 1977, et n° 84-204 au catalogue pour 1978, 1979, 1980 et 1981).

La production des estimations postcensitaires exige que l'on connaisse ces décès par année censitaire (1^{er} juin - 31 mai) selon l'âge et la génération, en l'occurrence l'année censitaire de naissance. Cette répartition selon la génération a été effectuée en distinguant trois cas selon l'âge au décès: zéro an, un an, deux ans et plus; d'après des observations portant sur différentes années, on a déterminé la répartition illustrée par le graphique IIb., à partir duquel il est aisé de déduire l'âge des décédés au début de l'année censitaire considérée, soit le 1^{er} juin 1979 dans l'exemple choisi ici.

$$(D_{(x)} = \text{Deaths at age } x) - (D_{(x)} = \text{décès à l'âge } x)$$

(b) Intercensal Population Estimates by Age and Sex as of June 1, 1977-1981

The production of intercensal estimates can be broken down into three stages: the calculation of the error of closure, the distribution of this error, and the final adjustment of the estimate.

(i) Calculation of the Error of Closure

This error represents the difference between the updated postcensal estimate of June 1, 1981 explained above, and the census population counts for the same date. This difference can therefore be calculated by sex and individual years of age.

(ii) Distribution of the Error of Closure

The production of intercensal estimates, i.e., those which are consistent with the results of both the 1976 and 1981 Censuses, involves the production of a series of estimates wherein the results for June 1, 1981 correspond to the actual census population counts of June 3, 1981 adjusted to June 1. To do this, it is necessary to distribute the error of closure over the 1976-1981 period.

The method of distribution depends largely on the source of this error of closure. The latter is the combination of mainly two types of errors: those due to differences in the amount of undercoverage in successive censuses, on the one hand, and those originating in the estimates of the components of population change, on the other hand. However for the cases which are of interest here, it is impossible to determine precisely how much of this error is attributable to differences in the amount of undercoverage⁽³⁾ and how much is due to each component involved, particularly since they would probably vary according to the sex, age and province concerned. It seemed reasonable to assume, then, that the error of closure for a given cohort is a linear function of the time elapsed since the 1976 census.

⁽³⁾ Undercoverage estimates for Canada (excluding the Yukon and the Northwest Territories) were compiled by sex and selected age groups only (refer to Appendix Table 11), while provincial undercoverage estimates were compiled irrespective of age and sex.

b) Estimations intercensitaires de la population selon le sexe et l'âge au 1^{er} juin 1977-1981

On peut distinguer trois étapes dans la production des estimations intercensitaires: le calcul de l'erreur en fin de période intercensitaire, la répartition de cette erreur et l'ajustement final.

(i) Calcul de l'erreur en fin de période intercensitaire

Cette erreur représente la différence entre l'estimation postcensitaire corrigée au 1^{er} juin 1981 calculée ci-dessus et l'effectif recensé à la même date. On peut donc calculer une telle différence selon le sexe et pour chaque année d'âge.

(ii) Répartition de l'erreur en fin de période intercensitaire

Produire des estimations intercensitaires, c'est-à-dire compatibles avec les recensements de 1976 et de 1981, revient en fait à produire une série d'estimations telle que l'on ait, pour le 1^{er} juin 1981 des résultats qui coïncident avec ceux du recensement du 3 juin 1981, ajusté au 1^{er} juin. Pour cela, il faut répartir l'erreur en fin de période sur la période quinquennale 1976-1981.

La méthode de répartition dépend en grande partie de la source de cette erreur en fin de période. Or celle-ci est surtout la combinaison de deux types d'erreurs: celles dues au sous-dénombrement différentiel d'un recensement à l'autre, d'une part, et celles provenant de l'estimation des composantes, d'autre part. Il est cependant impossible de déterminer avec précision la part de l'erreur attribuable au sous-dénombrement différentiel et à chacune des composantes en cause dans tous les cas qui nous intéressent⁽³⁾ cette part peut notamment varier selon le sexe, l'âge et aussi la province concernée. Il a semblé acceptable de faire l'hypothèse que l'erreur en fin de période est à l'intérieur d'une même génération, une fonction linéaire du temps écoulé depuis le recensement de 1976.

⁽³⁾ En effet, pour le Canada (sans le Yukon et les Territoires du Nord-Ouest), le sous-dénombrement n'a été estimé que pour certains groupes d'âges (voir le tableau 11 en appendice) et selon le sexe. Dans le cas des provinces, ce calcul n'a été fait qu'au niveau de l'ensemble de la population.

As is illustrated in Chart IV, for purposes of distributing this error, the population was broken down into three groups according to age as of June 1, 1981 - 0-3 years, 4-89 years and 90 years and over. Thus, for example, if E_2 is the error of closure for individuals whose age at last birthday was two on June 1, 1981 one third of this error will be attributed to the June 1, 1979 population estimate, while two-thirds will be attributed to the June 1, 1980 estimate. For individual ages 4 to 89 inclusive, the error E_x was distributed as follows: 1/5 to the June 1, 1977 estimate, 2/5 to the June 1, 1978 estimate, etc. For individuals who were 90 years of age and over on June 1, 1981, 1/5 of the error E_{90+} was attributed to the June 1, 1977 estimate of the 86 + population, 2/5 to the June 1, 1978 estimate of the 87 + population, etc. The error calculated for these various age groups (86 and over in 1977, 87 and over in 1978, etc.) then has to be distributed according to individual years of age in proportion to the number of persons in the various ages, as reflected by the updated postcensal estimates.

The portion of the error of closure attributable to the June 1 updated postcensal estimates for the years 1977 through 1980 has now been determined. To obtain the desired intercensal estimates, this error is simply added to or subtracted from the updated postcensal estimate for the corresponding year, depending on whether the corrected postcensal estimate of June 1, 1981 is lower or higher than the actual census count for the cohort in question.

(iii) Final Adjustment

The above calculations produced a series of intercensal estimates which differ slightly in aggregate (both sexes) from the total population intercensal estimates. The difference(4) was proportionally distributed by sex among the various ages. These adjusted intercensal estimates are tabulated in Tables 2 to 5 in the appendix.

(c) Interpretation of Findings

It should be recalled that the population figures published here for years other than census years are estimates and, as such, are subject to certain errors.

(4) Before calculating this difference by sex, it was first necessary to distribute the totals by sex, assuming a linear change in the sex ratio between 1976 and 1981 Censuses.

Comme l'illustre le graphique IV, on a distingué trois cas selon l'âge au 1^{er} juin 1981 - 0-3 ans, 4-89 ans et 90 ans et plus - pour répartir cette erreur. Ainsi, par exemple, si E_2 est l'erreur en fin de période observée chez les individus âgés de deux ans révolus le 1^{er} juin 1981 on considèrera qu'un tiers de cette erreur a été commis lors de l'estimation de la population au 1^{er} juin 1979 et deux tiers le 1^{er} juin 1980. Pour les âges 4 à 89 ans, l'erreur E_x a été répartie comme suit: 1/5 le 1^{er} juin 1977, 2/5 le 1^{er} juin 1978 etc. Quant aux individus de 90 ans et plus au 1^{er} juin 1981 on a considéré que 1/5 de l'erreur E_{90+} portait sur l'estimation de la population âgée de 86 ans et plus le 1^{er} juin 1977, 2/5 sur celle âgée de 87 ans et plus le 1^{er} juin 1978, etc. Il reste à répartir selon l'année d'âge l'erreur ainsi calculée pour ces divers groupes d'âges (86 ans et plus en 1977, 87 ans et plus en 1978, etc.) cette répartition a été effectuée au *prorata* de la population des divers âges, telle que reflétée par les estimations postcensitaires corrigées.

On connaît maintenant, selon le sexe et pour chaque année d'âge, la part de l'erreur en fin de période que l'on a attribuée à l'estimation postcensitaire corrigée au 1^{er} juin des années 1977-1980: pour obtenir les estimations intercensitaires cherchées, il suffit de retrancher ou d'ajouter cette erreur à l'estimation postcensitaire corrigée de l'année correspondante, selon que l'estimation postcensitaire corrigée au 1^{er} juin 1981 sera supérieure ou inférieure aux effectifs recensés à la même date, pour la génération en cause.

(iii) Ajustement final

Le calcul qui précède a conduit à une série d'estimations intercensitaires qui présente quant à l'effectif total (sexes réunis), de légères différences avec les estimations intercensitaires de la population totale. Pour la population de chaque sexe, on a réparti cette différence(4) au *prorata* de l'effectif des divers âges. Les estimations intercensitaires ainsi ajustées sont reproduites dans les tableaux 2 à 5 en appendice.

c) Interprétation des résultats

Rappelons que, pour les années où l'on ne dispose pas d'un recensement, les effectifs de la population publiés ici sont des estimations et comportent une certaine marge d'erreur.

(4) Pour calculer cette différence selon le sexe, on a dû au préalable répartir selon le sexe les effectifs totaux: pour cela, on a fait l'hypothèse que le taux de masculinité évolué linéairement entre les recensements de 1976 et de 1981.

Method of Distributing the Closure Error by Cohort

Méthode de répartition de l'erreur en fin de période intercensitaire suivant la génération

(E_x = Closure error at age x) — E_x = Erreur en fin de période intercensitaire à l'âge x)

The intercensal estimates which are based on the results of the 1976 and 1981 Censuses are subject to the error of closure described previously. Table 10 in the appendix gives some indication of the magnitude of this error at the national level. The error of closure is mainly attributable to two sources:

- (a) Differences in the amount of undercoverage from one census to the next: for a given cohort group, the number of persons not enumerated in the 1976 and 1981 Censuses generally differs. Thus, even assuming that the components of population change could be exactly estimated, an error of closure would still be present. (5) Table 11 (appendix) shows estimates of undercoverage for Canada (excluding the Yukon and the Northwest Territories) by sex and selected age groups in the 1976 and 1981 Censuses.
- (b) Errors in the estimates of the components of population change; these errors may vary in magnitude according to the age, sex and province concerned. It should be pointed out that the errors in the estimates of certain components such as births or emigration may affect some age groups more than others.

Finally, it should be noted that the disparity between the actual census count and the postcensal estimate for the same date (see Table 10 in the appendix) is a reflection neither of the quality of the census nor that of the estimates.

- (5) Consider the following example for Canada, excluding the Yukon and Northwest Territories: on June 1, 1976, 1.93% of the men aged 15-19, or approximately 23,500 individuals, were not enumerated. On June 1, 1981, 6.03% of the men from the same group of cohorts (who were, therefore, in the age group 20-24 at the time) and present in Canada, or approximately 75,100 individuals, were not enumerated. Therefore, even if the estimates of the components of population change were exactly correct, there would still be a difference of $51,600 \pm 19,400$ at the 95% confidence interval between the updated postcensal estimate and the actual census count. In point of fact, an error of closure of this very size was observed in the case of men aged 20-24 on June 1, 1981. This is an example of a case in which the differences in the amount of undercoverage from one census to the next was responsible for a good part of the error of closure.

Ainsi, dans le cas des estimations intercensitaires, qui tiennent compte des résultats des recensements de 1976 et de 1981, se pose le problème déjà évoqué de l'erreur en fin de période; le tableau 10 en appendice donne une idée de son importance au niveau du Canada. Cette erreur est surtout attribuable à deux sources:

- a) Le sous-dénombrement différentiel, d'un recensement à l'autre: en effet, pour un même groupe de générations, le nombre de personnes non recensées n'est en général pas le même le 1^{er} juin 1976 et le 1^{er} juin 1981. Donc, si on suppose que l'on puisse estimer parfaitement les composantes de l'accroissement démographique, il subsisterait tout de même une erreur en fin de période intercensitaire (5). Le tableau 11 in appendice donne, à titre d'idée, l'estimation du sous-dénombrement selon le sexe et certains groupes d'âges lors des recensements de 1976 et de 1981, au niveau du Canada (sans le Yukon et les Territoires du Nord-Ouest).
- b) L'erreur provenant de l'estimation des composantes et dont l'importance peut varier suivant le sexe, l'âge ou la province. Mentionnons notamment que des erreurs portant sur certaines composantes (naissances ou émigration, par exemple) peuvent affecter davantage certains groupes d'âges.

Soulignons enfin que l'écart constaté entre l'effectif recensé et l'estimation postcensitaire à la même date (voir le tableau 10 en appendice) ne constitue pas plus une mesure de la qualité du recensement que de celle des estimations.

- (5) Illustrons cela par un exemple concernant le Canada (sans le Yukon et les Territoires du Nord-Ouest): le 1^{er} juin 1976 1.93% des hommes de 15-19 ans, soit environ 23,500 individus, n'ont pas été recensés. Le 1^{er} juin 1981, 6.03% des hommes issus du même groupe de générations (donc âgés de 20-24 ans à cette date) et présents au Canada n'ont pas été dénombrés, soit environ 75,100 individus. Donc, même si l'estimation des composantes ne comportait aucune erreur, il subsisterait une différence de $51,600 \pm 19,400$ selon l'intervalle de confiance à 95% entre l'estimation postcensitaire corrigée et le recensement. Or, c'est justement une erreur en fin de période de cet ordre que l'on a observée chez les hommes de 20-24 ans le 1^{er} juin 1981. Ceci est un exemple de cas où le sous-dénombrement différentiel est responsable d'une importante partie de l'erreur en fin de période intercensitaire.

(ID): Final Intercensal Estimates: Census counts adjusted to June 1.

Estimations intercensitaires définitives: Chiffres du recensement ajustés au 1er juin.

-- : Less than 50 persons. - Moins de 50 personnes.

Note: Each figure has been rounded independently to the nearest hundred.

Nota: Chaque nombre a été arrondi individuellement à la centaine près.
